

ABSTRACT

A fastener product for sealing an opening or frangible section of a container. The fastener product can be attached with an adhesive layer and includes a first base having an inner face and an outer face opposite the inner face, the first base comprising a first array of fastening elements on a first portion of the inner face and an adhesive coating on a second portion of the inner face and a second base having an inner face and an outer face opposite the inner face, the second base comprising a second array of fastening elements releasably engageable with the fastening elements of the first base on the outer face and an adhesive coating on the inner face of the second base. The first portion of the first base partially overlaps the second base. The first and second arrays of fastening elements may include engageable hook and loop elements.
